DETAILED ACTION

Responsive to Mr. Jeffrey Melcher telephone called on October 6, 2005, the office action mailed October 4, 2005 was inadvertently made final and according is withdrawn and the statutory period set therein vacated. A new office action on the merits/follows.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 1. Claims 11-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nilsson (6,062,547) in view of Kohl (4,773,918). Regarding claims 11-16, Nilsson '547 discloses a process for the recovery chemicals and energy the spent liquor obtained in the chemical pulping process (Col. 7, lines 56-60) comprising: gasifying the spent liquor (Col. 5, lines 5-7) under sub-stoichiometric conditions (Equations 1-6, Col. 3 and Col. 4) in a burner (Col. 5, lines 5-12) produce partly at least one phase of solid and/or fused material (Col. 6, lines 24-25) and partly at least one phase of a flammable gaseous material (Col. 5, lines 28-29); removing the phases from the burner (Col. 5, lines 26-28)

Art Unit: 1764

and separating the phases of solid and/or fused material (compound separated structure 2) from the phase of flammable gaseous material such that the solid and/or fused material is dissolved and collected as product liquid in a product liquid receiver (14); one or more cooling aqueous cooling media are contacted with combustion gas (Col. 5, lines 35-38), which cooling medium is at least partially vaporized or cracked to increase the calorific value of the flammable gaseous material and cooling medium is recovered in the chemical pulping process or in a process of chemicals and energy from the spent liquor (Col. 3, lines 38-45). Nilsson '547 fails to disclose the cooling medium (9) consists of an essentially water-free cooling medium. Kohl '918 teaches the essentially water-free cooling medium or gaseous fuels (oil, petroleum coke, natural gas, volatile hydrocarbons) can be added directly to the product gas to raise its heating value (Col. 7, lines 48-55). Thus, it would have been obvious in view of Kohl '914 to one having ordinary skill in the art to modify the gasification process of Nilsson '547 with the cooling medium as taught by Kohl '918 in order to increase the heating value of the product gas (flammable gaseous material). Note, the properties of gaseous fuels of Kohl '918 have a much lower temperature than the product gas (flammable gas material); thus, the gaseous fuels act as a cooling medium, which inherently cool the product gas. Regarding claim 17, Nilsson '547 discloses the contact between the flammable gaseous material and the product liquid is avoided (Col. 5, lines 35-36). Regarding claims 18 and 19, Nilsson '547 discloses the cooling medium (via nozzle 7) is sprayed into the mixture of solid and/or fused material and flammable gaseous material produced the gasification (Fig. 1), preferably connection the separation of these

Art Unit: 1764

two phases (Col. 6, lines 24-41) from each other. Regarding claim 20, Nilsson discloses the cooling is carried out a first stage (down-coming tube 2) in connection with the separation the material phases (solidified particles 5 and combustion gas) produced by gasification from each other, where after further cooling carried out in a second stage (cooling in second internal vessel 12, Col. 6, lines 61-67) with a second cooling medium consists essentially of water (Col. 7, lines 45-46). Regarding claim 21, Nilsson '547 discloses the separation in the separation forms a part of the total reaction vessel an essentially even temperature maintained, which temperature corresponds the gasification temperature (Col. 8, lines 1-15). Regarding claim 22. Nilsson '547 fails to disclose an inert gas is added above the product liquid receiver surface to form a protective blanket over the product liquid receiver to prevent carbonation boiling and splashing green liquor from the product liquid receiver. Kohl discloses the benefits of blowing the inert gas down the fuel bed to minimize entrainment of the solids in the gases rising from the fuel bed to create a distinct line of separation between zones (Col. 2, lines 5-9). Thus, it would have been obvious in view of the Kohl to one having ordinary skill in the art to modify the gasification process of the applied references with the inert gas in the fuel bed as taught by Kohl in order to gain the above benefits. Regarding claims 23 and 24, it is best understood by examiner (in view of Applicant's specification on page 5, lines 22-28) that Nilsson '547 discloses the aqueous water bath 11 in the second internal vessel 12 adjacent to the receiver liquor 14, and this aqueous water bath cools the solidified particles 5 prior to falling into the product receiving liquor 14 in the vessel 3.

Response to Arguments

Applicant's arguments filed September 14, 2005 have been fully considered but they are not persuasive. (1) With respect to the argument that Kohl fails to teach the essentially-water free cooling medium is added to the hot gas stream after it has left the burner to thereby cool the exiting hot gas stream, Examiner respectfully disagrees. It is submitted that Kohl teaches the "heating value can be increased by adding fuel such as oil or petroleum coke into the gasification zone... and... gaseous fuel such as natural gas or volatile hydrocarbons can, of course, be added directly to the product gas to raise its heating value." The product gas (hot combustible gas which rises from the gasification zone 14) inherently leaves the gasification zone 14 or the product gas is above the burner 14. Thus, Kohl suggests that the gaseous fuel can be added at the burner stage and/or after the burner stage. Note, there is no distinctive advantage of adding the gaseous fuel in the burner or after the product leaves the burner, since adding gaseous fuel to the product gas either at the burner or after the burner increases the heating value to the product gas. Note, the properties of gaseous fuels of Kohl '918. have a much lower temperature than the product gas (flammable gas material); thus, the gaseous fuels act as a cooling medium, which inherently cool the product gas. Examiner agrees that the hot gas leaving the reactor is cooled by using water in the steam generator stage 68; however, this cooling stage takes place much further downstream of the gasification zone.

Application/Control Number: 09/937,659

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Tom P. Duong whose telephone number is (571) 272-

2794. The examiner can normally be reached on 8:00AM - 4:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Glenn Caldarola can be reached on (571) 272-1444. The fax phone number

for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
